

ABSTRACT

A work table includes a work surface having two generally parallel bars extending across and above the work surface. Two sleeves are slidably connected to the two generally parallel bars, each sleeve of the two sleeves positioned around each bar of the two generally parallel bars. A power tool, such as a tile saw is connected between the two sleeves and thereby slides along the two bars. A channel is preferably positioned across the work surface and includes water or similar coolant/lubricant for the power tool. Handles are additionally positioned in the side of the work surface and are moveable between a retracted position within the work surface and an extended position away from the work surface. In the extended position, the handle includes a top edge generally flush with the work surface.
